

Stakeholders

Tier 1 — Must Interview (Non-Negotiable)

1. Your Capstone Supervisor / Faculty Advisor

Ask them:

- What is the exact evaluation rubric? (Working demo? Written report? Defense presentation? Security analysis?)
- What counts as "functional" for the grading panel?
- Is blockchain deployment to a testnet required, or is Ganache acceptable for the demo?
- Are there institutional privacy/ethics constraints on the project?

Why this matters: You might be over-engineering for the wrong rubric. Or under-engineering for a criteria you didn't know existed. Find out now.

2. Your 3 Teammates (Anu, Swati, Garv)

This isn't a social check-in. This is a structured technical elicitation session. You need answers to:

- Who owns the admin key decision? (Team consensus required — documented in your memories)
- What are their technical blockers to starting work in Week 2?
- What assumptions are they each making that haven't been validated?
- What does each person need from the IVoting.sol interface to do their job?

Run this as a meeting with a fixed agenda and document the outputs. No vague "we discussed it" notes.

Tier 2 — Interview if Time Allows

3. A Real Election Administrator (Local body, college union, club)

Ask them:

- What are the biggest fraud risks in real elections?
- What does a valid voter credential look like in practice?
- What would make them trust a digital result?

Why this is valuable: Grounds your requirements in real-world legitimacy rather than purely theoretical specs. Also useful for your project report.

4. A Potential Voter (Student who would use this system)

Ask them:

- Do you understand what a blockchain wallet is?
- Would you trust a system where your vote is "on a blockchain"?
- What would you need to see to believe your vote was counted?

Why this is valuable: Surfaces usability requirements. Garv's frontend needs to work for someone who doesn't know what MetaMask is.

Tier 3 — Skip (Not Worth Your Time This Week)

- General public surveys — too slow, too noisy
- Other developers — they'll give you implementation opinions, not requirements
- Academic papers — useful for background, not for eliciting requirements
